

ABSTRACT OF THE DISCLOSURE

[0113] A method and apparatus for providing an independent display system for a computer aided detection (CAD) system that analyzes medical images. The independent display system comprises a screen to display a medical image including any marked regions of interest and a plurality of icons to interact with the screen. For one embodiment, the screen is a touch screen, such that the independent display system does not require a keyboard or cursor controller.

FIG. 1 is a block diagram of a system for providing an independent display system for a computer aided detection (CAD) system that analyzes medical images.
